

Please put them back in order, so we can get started!

The top and bottom lines have no spaces and start with T and B.

[illegible]

Output

Knowing the largest widths, find those lines (one of each).

Any widths smaller than those come in pairs and should be placed above and below, decreasing symmetrically to make the head, middle and bottom of the snowman cutout.

Place the (T)op and (B)ottom at the top and bottom of the page and we'll start taping!

[illegible]

Discussion

The smallest width of each section is wider than any part of the prior section. For example, above, the widths in the Middle section are 7, 9 and 11, all of which are wider than the Head section with widths 3 and 5. And the Bottom section widths are 17,21,23,27, all wider than the Middle.

Note, the size of difference in spaces between layers will not always be the next level down by 2. In the example given, the head progresses for a midpoint layer of size 5, then the next layer above and below that is of size 3. The middle section starts with a layer of size 11, then the next two layers are size 9 and then size 7.

However, the base section jumps around a little bit -- it is still symmetrical, but the sizes and the layers jump from 27 to 23, then 21 and finally 17. You need to take that into account when building your algorithm.
